Safely

Direct Input

Predictive Chemical Inventory Management (PCIM) is an inventory management optimization system that analyzes current day-to-day data provided by businesses and people, and suggests actions which can be taken to reduce supply costs, maximize storage, or enhance operations.

Predictive Strategy

Three major causes of unplanned downtime due to loss of supply are over-purchasing, under-purchasing, and material formulation and substitutions that are not planned for.

Our team will monitor the condition of your assets, operations and current or future goals specifically against established baselines and market conditions. We collect conditional data and compare it to your previous history and project any abnormalities or inefficiencies with current inventory.

Efficient Value

Our innovative approach to inventory management is a one of a kind solution to maintaining high profit margins. It's a streamlined program that enables you to set and measure objectives and plan the vital direction of your business.

Return on investment: up to 5 times

Reduction in material costs: 5% to 20%

Elimination of breakdowns: 70% to 75%

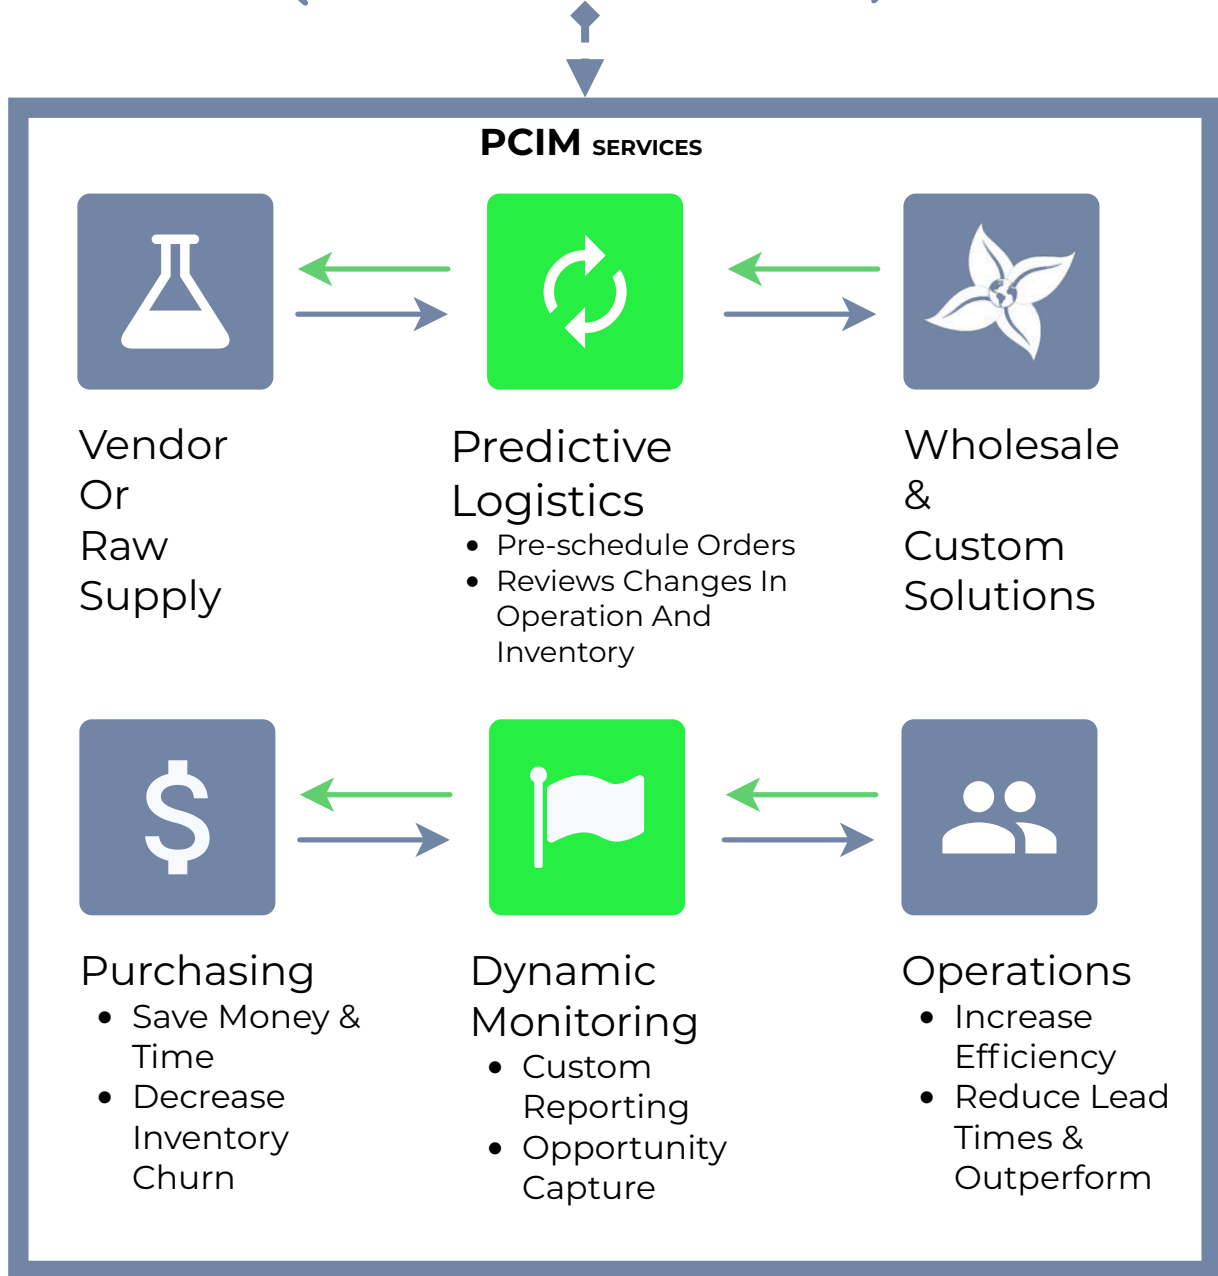

Reduction in downtime: 45% to 65%

Increase in production: 20% to 25%
